Audiometry - Tympanometry (P_AUXTYM)

Data File: P_AUXTYM.xpt

First Published: March 2022

Last Revised: NA

Component Description

The NHANES program suspended field operations in March 2020 due to the coronavirus disease 2019 (COVID-19) pandemic. As a result, data collection for the NHANES 2019-2020 cycle was not completed and the collected data are not nationally representative. Therefore, data collected from 2019 to March 2020 were combined with data from the NHANES 2017-2018 cycle to form a nationally representative sample of NHANES 2017-March 2020 pre-pandemic data. These data are available to the public. Please refer to the Analytic Notes section for more details on the use of the data.

The audiometry examination component includes one main audiometry data file (P_AUX) and three middle ear testing data files. This tympanometry data file (P_AUXTYM) is one of quantitative measurements collected in the middle ear testing to evaluate the functional health of the middle ear system. The tympanometry measures the compliance of the tympanic member while different pressures are being applied to the external ear canal. The purpose of the present data file is to provide the underlying raw data curves for this set of tympanograms, which will allow analysts to display actual tympanograms, make qualitative judgments regarding test adequacy and interpretation, and to perform quantitative analyses.

Eligible Sample

All participants aged 6–19 years and 70 years and older in the NHANES 2017-March 2020 pre-pandemic sample were eligible. There were no precluding conditions for any part of the audiologic exam. However, participants using hearing aids who were not able to remove them for testing and participants who had sufficient ear pain at the time of the exam that they could not tolerate headphones were excluded.

Protocol and Procedure

An Interacoustics Titan (middle ear analyzer) was used to conduct three middle ear tests: tympanometry, wideband reflectance, and acoustic reflex threshold screening. Trained examiners performed the middle ear testing on survey participants in a sound-isolating room in the NHANES Mobile Examination Center (MEC). Tympanometry measures the movement of the eardrum in terms of how much sound is delivered through the middle ear system at a single frequency (226 Hz) across a range of pressures. The tympanometry testing produced an electronic output. The single best curve data for each ear obtained during the testing was captured and uploaded for data processing. Please refer to the NHANES Audiometry Procedures Manual for further information on the middle ear testing

Quality Assurance & Quality Control

The physical volume calibration of the Titan was checked daily throughout the testing and at the start and end of each survey location. In addition, the MEC health technicians ran a sample test on one ear to ensure that the unit is producing clear, normal graphs. The Titan also received an exhaustive National Institute of Standards and Technology traceable calibration check annually.

The MEC health technicians who performed the tympanometry testing were professionally trained by a

certified audiologist from the National Institute for Occupational Safety & Health (NIOSH). The NIOSH audiologist monitored the performance of each health technician on a regular basis and visited each MEC at least three times per year. Additionally, NCHS project officers visited each MEC approximately twice per year to observe the audiometry examinations and verify that standard testing procedures were being followed. NIOSH consultants provided the MEC health technicians with annual retraining and protocol updates.

Data Processing and Editing

The Titan tympanometer collected two array data (pressure array TYXP001-TYXP256, and admittance array TYXA001-TYXA256) and summary variables (middle ear pressure, physical volume, compliance, and tympanometric width) for each ear (TYXPEAR 1=right ear 2=left ear). All data were automatically captured and uploaded into the NHANES computerized database system. On a continuous basis, a consulting audiologist performed a clinical review of all data for each subject as it was received, checking for quality and consistency.

The post-data collection review also included rating the quality and classifying the type of each tympanogram. A few tympanometric summary values for middle ear pressure, compliance, and tympanometric width from artifact were edited to "missing," while their corresponding raw data for tympanometric curves were included in this data file as they were collected. Tympanometric summary values and curves from the equipment failure were deleted. Tympanometric summary variables (AUXTMEPR, AUXTMEPL, AUXTPVR, AUXTPVL, AUXTCOMR, AUXTCOML, AUXTWIDR, and AUXTWIDL), quality rating variables (AUAREQC, and AUALEQC), and tympanogram type variables (AUATYMTR, and AUATYMTL) are included in the separately released data file P_AUX.

The P_AUXTYM data format and variables are the same as the 2017-2018 data (AUXTYM_J). Most participants have two records (one for the right ear and one for the left ear). Some participants have only one record (either one of the ears). Eligible participants who did not have tympanogram data on both ears are excluded from this data file. The final P_AUXTYM data file contains 8,910 observations and 514 variables.

Analytic Notes

The COVID-19 pandemic required suspension of NHANES 2019-2020 field operations in March 2020 after data were collected in 18 of the 30 survey locations in the 2019-2020 sample. Because the collected data from 18 locations were not nationally representative, these data were combined with data from the previous cycle (2017-2018) to create a 2017-March 2020 pre-pandemic data file. The resulting exam sample weights in the demographic file should be used to calculate estimates from the combined cycles. These exam sample weights are not appropriate for independent analyses of the 2019-2020 data and will not yield nationally representative results for either the 2017-2018 data alone or the 2019-March 2020 data alone. Please refer to the NHANES website for additional information for the NHANES 2017-March 2020 pre-pandemic data, and for the previous 2017-2018 public use data file with specific weights for that 2-year cycle.

The tympanometry portion of the data file represents the raw data as it was collected. It contains a series of 256 x-y pressure-compliance variables and another variable (TYXPEAR) to indicate tested ear. Compliance values range from 0.09 to 8.89 in cubic centimeters and pressure values range from -299 to +199 daPa. One daPa is equivalent to the pressure of 1.02 mm H2O. These data can be used to create tympanometric curves of compliance as a function of pressure for each ear. Most participants have two curves: one for the right ear and one for the left ear. Some participants have only one curve: either right ear or left ear. Eligible participants who did not have a tympanometry test on both ears are excluded from this data file.

The "Titan" tympanometer adjusted the speed at which pressure was changed based on how quickly the eardrum compliance changed with the pressure, resulting in a variable number of pressure-compliance measurements. Typically, at high positive or negative pressures (near the ends of the tympanometry curve), eardrum compliance varies little as the pressure changes; in the portion of the curve, the equipment sampled fewer points. However, near the tympanometric peak, compliance changes quickly with pressure changes; in this point of the curve, the equipment sampled more points. Most tympanograms contain 120-160 data points; however, tympanograms could contain as many as 256 data points in this data file. Tympanograms with a very high number of data points could represent any number of issues, such as very deep peaks, multiple peaks due to noise, or difficulties obtaining the tympanogram with involved a seal being obtained and lost several times in quick succession.

Please refer to the NHANES Analytic Guidelines and the online NHANES Tutorial for further details on the use of sample weights and other analytic issues.
